

What kind of YouTube cover do viewers like?

(learn cover preference and predict click rate for each cover)

01 Collect data (use public API to scrape data)

- include:
 - YouTube cover
 - channel id
 - time
 - title
 - category
 - views

influenced by both the number
of subscribers and the account's
paid traffic distribution,

02 Metrics: click rate = views / total traffic (exposure)

03 Method: click rate as metrics, feed all video covers we collect into the process, and let neural network learn which type of video cover has a higher click rate.

04. Problem we face: we can't get the traffic data of each video, which is the private data of TikTok, then we cannot get the click rate.

05. Solution: Combine cover with relatively consistent exposure into 1 input, collect 1000 input, let neural network learn within each input, then stack the result (row) of these 1000 learning together for global learning.
